#### Introduction

Image from US Energy Information Administration (2011)

#### **Green buildings**

- Material manufacture
  - Environmentally friendly, renewable and low embodied energy materials
- Use phase
  - Efficient heating, ventilating and lighting systems
  - Adaptation or reconfiguration
- End of life
  - Minimum amount of waste and pollution
  - Reusable and recyclable materials

#### Material flow of current buildings

## Design for Deconstruction: Experimental Testing Program

- Pushout test: evaluate a wide range of parameters and formulate strength design equations
- Beam test: study the clamp connector behavior in a realistic manner
- Precast connector test: test the strength and ductility of the plank connectors under tensile and shear loading
- Diaphragm test: investigate the in-plane seismic behavior of the composite floor system

#### **Pushout Tests: Computational Simulation**

Loading process

- Pretension in the bolt is obtained by assigning thermal coefficient to the shank and decreasing the temperature.
- The steel beam is then loaded in the axial direction using displacement control.

Boundary conditions and load application

#### Interaction

- Frictional coefficient: 0.3, except for the contact between the plank and the concrete strong floor, which is frictionless
- Rebar: embedded in the concrete plank

## **Pushout Tests: Constitutive Relations**

#### Material constitutive model

- Concrete damaged plasticity model
  - Failure mechanism: tensile cracking and compressive crushing
  - Capture stiffness recovery due to crack opening and closing under cyclic loading
- Steel beam, rebar and cast-in channels: elastic-perfectly-plastic material
- Bolts: A325 bolts (Grade 8.8 bolts)

#### **Pushout Tests: Computational Simulation Results**

## **Pushout Tests: Limit States Observed in Computational** Simulation

Conclusions

#### **Conclusions**

- A new deconstructable composite floor system, consisting of steel framing, precast concrete planks and clamping connectors, is presented.
- The clamping connector has a relatively high ultimate strength and behave ductile; therefore, they can be used as connectors in composite beams.
- Using shims for thin flange sections reduces the frictional strength slightly.
- As a result of damage accumulation in concrete, the strength of the connector reduces under cyclic loading. Three channel configuration fails by concrete crushing.
