Engineering Education – The Greatest Challenge

ABSTRACT:

In the past few years, enrollment in engineering has increased slightly, but the longer run picture is not so clear. In 1985, almost 10% of all BS degrees were in engineering but today the same number is around 5%. What should engineering programs be doing differently to attract and retain students in engineering? In particular, is Northeastern poised to increase its influence and lead in engineering education?

Refreshments will be served.
